

5 SIGNS YOUR AC UNIT NEEDS REPAIRS

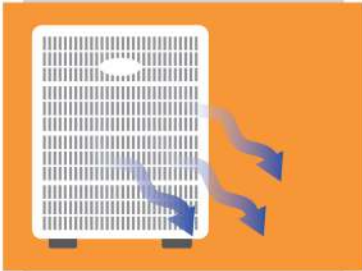

It doesn't always take an expert to detect the common signs of a broken air conditioning unit. Keep this checklist handy so you know when it's time to call J&W Heating and Air to service your AC system.

YOUR AC UNIT STOPPED BLOWING COLD AIR

An air conditioner blowing warm air is worse than no air conditioner at all. If this is the case, either the system's compressor is failing, the duct work is sub-par, or debris has built up in the AC vents. When you notice the decreased air flow coming from your AC system, a diagnostic test is necessary to find the source of the problem.

YOUR AC UNIT HAS LITTLE TO NO AIR FLOW

Weak air flow can be the result of a few symptoms. Either the compressor is failing, the duct work is sub-par or debris has built up in the AC vents. When you notice decreased air flow coming from your AC system, a diagnostic test is necessary to find the source of the problem.

YOU'VE BEGUN TO NOTICE MOISTURE AROUND YOUR AC UNIT

When you begin to see leaks around the AC system, it's typically because of two problems. Either the drain lines are blocked or the refrigerant is leaking. If it's the latter, then your family is at serious risk and action must be taken immediately. When you begin to see moisture, call an expert immediately.

YOUR AC UNIT IS MAKING WEIRD NOISES

Not only do the grating and squealing sounds get annoying, but they're also a sign of serious issues. If you don't have your AC system serviced immediately after the sounds begin, you could be looking at a pricey AC unit replacement.

YOUR AC UNIT SMELLS

If foul smells start to flow out of your AC unit, it's likely burnt out wire insulation, or biological growth. Both are serious problems that an expert can take care of, and you can't afford to ignore it.
